

LLM-Driven Code Evolution: Framework and Code Pipeline

Each agent runs LLM-authored evaluate()/decide() code; classical selection acts on it; LLM re-enters as a directed mutation operator

GENERATION LOOP (G=10 by default) → DonorGame.run_simulation(T=20) → select_survivors → mutate_batch → repeat

Purple = LLM • Green = game env • Blue = agent code • Red = selection • Orange = sandbox/validator • Brown = observability
