

# Schmid-style fixation benchmark — ae0\_seed1 (N=20, 1% action + 1% observation error, $\beta=1$ )

Payoff advantage of the candidate, per composition  
 above 0 = candidate fitter at that mix; crossing 0 = interior equilibrium  
 shaded band =  $\pm 1$  s.d. over 5 replicates  
 (!) 5 probe(s) still drifting (worst ALLC at 0.12); raise --burn-in

Fixation probability vs the neutral benchmark  
 whiskers = rho at  $\pm 1$  s.d. of the 5-replicate payoff spread
